Cross Docking

"Saving operational time by reducing processes"

The **Cross Docking** solution is **order picking** based on the **Put To Light** solution, in which the goods are distributed directly to the user without going through a prior storage period.

The goods remain in the warehouse for a very short time after reception, so thanks to this methodology the goods are not stored, avoiding duplication of processes.
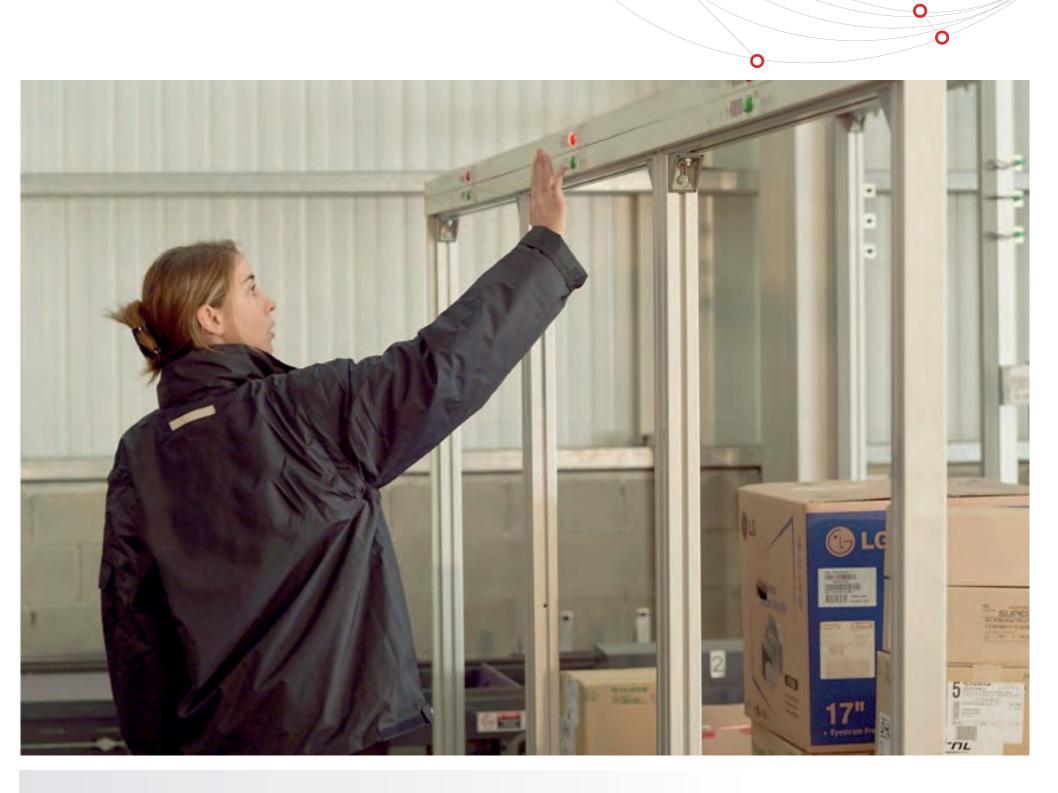

Cross Docking leads to shorter delivery times, a decrease in the number of operations and handling of loads, savings in storage space along with energy savings in relation to transport within the warehouse or distribution centre.

BENEFITS

i

Our solutions are designed to quickly prepare orders and prevent service errors.

ii

Implementing Pick-to-Light systems leads to improved productivity and outstanding user acceptance.

iii

In addition, the integration of our systems with the user's software solution (WMS or ERP) is quick and straightforward.
